Notes: * $p < 0.10$, ** $p < 0.05$, *** $p < 0.01$, using conventional p-values. Standard errors appear in round brackets. Square brackets contain sharpened q-values. Synthetic examples, not empirical findings. Outcome definitions and data generation are in examples/stata/data.do. OLS with heteroskedasticity-robust standard errors; specification 1 has no additional controls; specification 2 controls for x. No fixed effects or weights. Sharpened q-values use Anderson (2008) and BKY (2006), conventional p-values, a .001 grid and a complete outcome family for each panel and treatment effect. No RI was run. Control means use arm=0 at endline in each model's estimation sample; missing model variables are excluded model by model. Equality-test rows report unadjusted robust Wald F p-values for treatment 1 versus each other treatment, using the model covariance and residual degrees of freedom. Repeated effects are layout copies, each retaining its original panel-by-treatment family; no new empirical claims are made.
